

What is claimed is:

1. A structure of electro-optics device with a high efficiency, comprising:  
a plurality of convex die carriers, wherein a convex portion of each of the  
plurality of convex die carriers is defined as a cell-fixing surface; and  
a plurality of electro-optics cells, and each of the plurality of electro-optics cells  
has a first electrode and a second electrode, wherein the first electrode is electrically  
connected with each of the plurality of convex die carriers and the second electrode is  
electrically connected with a lead frame.
- 10 2. The structure of electro-optics device with a high efficiency of claim 1, wherein  
the structure further comprises a transparent fixing-glue which is used for fixing each  
of the plurality of convex die carriers and each of the plurality of electro-optics cells.
- 15 3. The structure of electro-optics device with a high efficiency of claim 1, wherein  
the structure comprises a plurality of light reflecting layers located on the surface of  
each of the plurality of convex die carriers.
- 20 4. The structure of electro-optics device with a high efficiency of claim 1, wherein  
each of the plurality of electro-optics cells is selected from the group consisting of a  
light-emitting cell, a PIN photo diode cell, an avalanche photo diode cell, a metal-  
semiconductor-metal photo detector cell, a metal-oxide-semiconductor field effect  
transistor cell, and a metal-semiconductor field effect transistor cell.

5. The structure of electro-optics device with a high efficiency of claim 1, wherein  
a silver paste is used for wire bonding between the first electrode and the cell-fixing  
surface.

5

6. The structure of electro-optics device with a high efficiency of claim 1, wherein  
a conductive paste is used for wire bonding between the first electrode and the cell-  
fixing surface.

10

7. The structure of electro-optics device with a high efficiency of claim 1, wherein  
an eutectic method is used for wire bonding between the first electrode and the cell-  
fixing surface.

15

8. The structure of electro-optics device with a high efficiency of claim 1, wherein  
the plurality of convex die carriers further comprises:

a plurality of bases; and

a plurality of semiconductor bases, wherein a first surface of each of the plurality  
of semiconductor bases is located on each of the plurality of bases, and a second  
surface of each of the plurality of semiconductor bases has a convex portion, and the  
convex portion is the cell-fixing surface.

20

9. The structure of electro-optics device with a high efficiency of claim 8, wherein

the structure further comprises a light reflecting layer located on the convex second surface of each of the plurality of semiconductor bases.

10. The structure of electro-optics device with a high efficiency of claim 8,  
5 wherein a metal material is used for wire bonding between the first electrode and the  
cell-fixing surface.

11. The structure of electro-optics device with a high efficiency of claim 10,  
wherein the metal material is selected from the group consisting of AuSn alloy, PbSn  
10 alloy, PbIn alloy, PbSnAg alloy, AuSi alloy, AuGe alloy, AuBe alloy, InSn alloy,  
AgIn alloy, SnAg alloy, SnAgBi alloy, AuGeNi alloy, and In.

12. The structure of electro-optics device with a high efficiency of claim 1,  
wherein the cell-fixing surface is selected from a symmetric cell-fixing surface having  
15 a first pattern and a second pattern, the first pattern and the second pattern being  
mirror-reflected to each other.

13. The structure of electro-optics device with a high efficiency of claim 1,  
wherein the cell-fixing surface is selected from an asymmetric cell-fixing surface  
20 having a first pattern and a second pattern, the first pattern and the second pattern not  
being mirror-reflected to each other.

14. A method for forming a high efficiency electro-optics device, comprising:  
providing a plurality of convex die carriers having a convex portion defined as a  
cell-fixing surface;  
bonding a first electrode of an electro-optics cell on each of the plurality of cell-  
fixing surfaces to connect electrically with each of the plurality of die carriers; and  
connecting electrically a second electrode of the electro-optics cell with an  
electrical adapter.

15. The method for forming a high efficiency electro-optics device of claim 14,  
10 wherein the steps of providing the convex die carriers further comprise:

providing a plurality of bases;  
etching a plurality of semiconductor bases to form each of a plurality of convex  
cell-fixing surfaces on each of a plurality of first surfaces of the plurality of  
semiconductor bases; and  
15 fixing each of a plurality of second surfaces of the plurality of semiconductor  
bases on each of the plurality of bases.

16. The method for forming a high efficiency electro-optics device of claim 15,  
wherein the method further comprises a light reflecting layer (located) on each of the  
20 plurality of first surfaces of the plurality of semiconductor bases.

17. The method for forming a high efficiency electro-optics device of claim 14,  
wherein the electrical adapter is a lead frame.

18. The method for forming a high efficiency electro-optics device of claim 14,  
wherein the electrical adapter is a printed circuit board.

5        19. The method for forming a high efficiency electro-optics device of claim 14,  
wherein said electrical adapter is a metal base.

10      20. The method for forming a high efficiency electro-optics device of claim 14,  
wherein the method further comprises a step of providing a transparent fixing-glue for  
fixing each of the plurality of convex die carriers and the electro-optics cell.

15      21. The method for forming a high efficiency electro-optics device of claim 14,  
wherein the method further comprises~~a light reflecting layer~~<sup>an adhesive</sup>~~(plated)~~ on the surface of  
each of the plurality of convex die carriers.

20      22. The method for forming a high efficiency electro-optics device of claim 14,  
wherein the electro-optics cell is selected from the group consisting of a light-emitting  
cell, a PIN photo diode cell, an avalanche photo diode cell, a metal-semiconductor-  
metal photo detecting cell, a metal-oxide-semiconductor field effect transistor cell, and  
a metal-semiconductor field effect transistor cell.

23. The method for forming a high efficiency electro-optics device of claim 14,

wherein the method further comprises a step of providing a self-aligning process for fixing the first electrode and each of the plurality of cell-fixing surfaces, and the self-aligning process comprising:

forming a metal material on the first electrode;

5 forming a metal layer on each of the plurality of cell-fixing surfaces; and

under a specific temperature, contacting the metal layer and the metal material to form a metal bonding for accomplishing an electrical connection between the first electrode and the plurality of die carriers.

10 24. The method for forming a high efficiency electro-optics device of claim 23, wherein the metal bonding is an eutectic bonding.

25. The method for forming a high efficiency electro-optics device of claim 23, wherein the metal bonding is a metal melting.

15

26. The method for forming a high efficiency electro-optics device of claim 23, wherein the metal material is selected from the group consisting of an AuSn alloy, PbSn alloy, PbIn alloy, PbSnAg alloy, AuSi alloy, AuGe alloy, AuBe alloy, InSn alloy, AgIn alloy, SnAg alloy, SnAgBi alloy, AuGeNi alloy, and In.

20

27. The method for forming a high efficiency electro-optics device of claim 23, wherein the specific temperature is higher than the melting temperature of the metal

material.

28. The method for forming a high efficiency electro-optics device of claim 14,  
wherein each of the plurality of cell-fixing surfaces is selected from a symmetric cell-  
fixing surface having a first pattern and a second pattern, the first pattern and the  
second pattern being mirror-reflected to each other.

29. The method for forming a high efficiency electro-optics device of claim 14,  
wherein each of the plurality of cell-fixing surfaces is selected from an asymmetric cell-  
fixing surface having a first pattern and a second pattern, the first pattern and the  
second pattern not being mirror-reflected to each other.
